

Hook blocks with special features **Area of rotation limit also over 360°**

It is sensible to limit the area of rotation if the hook must reach certain positions when lifting and depositing the load. It is compulsory if a load handling attachment is attached to an electrical supply cable. In these cases, it avoids the supply cable from becoming damaged by repeated rotation in one direction.

Proximity switches ensure that the drive motors are switched off shortly before the stop limit is reached.

Alternatively, our distribution ring unit can be integrated for rotating attached load handling equipment with electrical input cable without limitations.
